# How to make the most out of one morpheme

*Disentangling the inflectional morphology  
of Ticuna's finite predicative head*

UNIVERSITÉ

## General objective

Make sense of the inflectional morphology of Ticuna's finite predicative head:  
sequence inconsistencies, non-compositionality, SBJ/OBJ ambiguity

- How many morphological slots? (syntagmatic)
- What morphemes in each slot? (paradigmatic)
- Interactions

Boring? Going into details will make apparent (hopefully) interesting phenomena

1. Introduction to data and language
2. Typological overview (and other relevant morphosyntactic information)
3. Pinning down the points at issue
4. Describing the remaining gray areas
5. Interpreting the description
6. Results

# 1. Introduction to data and language

Work in progress: comments more than welcome, please interrupt!

Based on field data (2015-2018, PhD project, Antoine GUILLAUME, DDL & Université Lumière–Lyon 2)

San Martín de Amacayacu (SMA) Ticuna (younger speakers' variety)

Elicitation for complete paradigms (mostly with Javier Sánchez Gregorio)

So far consistent with spontaneous/staged data (corpus  $\approx$  20,000 words)

Data essentially consistent with D. Anderson's (1962) on Cushillococha (Peru) Ticuna; (consistent with A. Skilton's?)

Ticuna  $\approx$  50,000~60,000 speakers (Peru, Colombia, Brazil); vital as a whole; SMA  $\approx$  550 speakers

Isolate (or Yuri-Ticuna?, Carvalho 2009, Goulard & Montes 2013)

## 2. Typological overview (and other relevant morphosyntactic information)

## Phonology

Relatively simple segmental inventory and syllable structure ( $\approx/(C)V(?) /$ )

Contrastive nasality (exact locus?)

Highly tonal (rich toneme inventory + use of toneme change for morphosyntactic purposes)

**N.B.:** practical orthography in this talk ( $\Rightarrow$  no claims as to phonology, but all contrasts maintained)

Relatively straightforward, but please note:

$\acute{x}$	low toneme	$y$	$[dʒ]$	$\ddot{u}$	$[\omega]$
$\bar{x}$	mid toneme	$ch$	$[tʃ]$		
$\acute{x}$	high toneme	$\tilde{g}$	$[\eta]$		
$x''$	extra high toneme	'	$[ʔ]$		

### **General morphosyntax**

Mostly agglutinative (morpheme boundaries often correspond to syllable boundaries)

Nominative-accusative

Morphological encoding of SBJ as proclitics attached to predicative head (never on SBJ argument itself); for OBJ (and other Cases), more complex

No clear-cut basic word order (often claimed SOV)

## Person & Number categories in pronominal morphology

1SG	1PL	
2SG	2PL	
3		(+ agrees in agreement classes)
4		(or “1PL.INCL”)

## 5 agreement Classes (C) for non-SAP (≈genders)

Distribution unclear, at least partially lexical (although some semantic motivation)

Agreement mostly within DP: demonstratives, “connectors”, nominal personal prefixes (“possessives”), NMLZs... + person indexes procliticized to predicative head

Tagging:	C1	C2	C3	C4	C5
	ngēmà	ngémà	yîmà	yî'émá	yǐmá

#### 4 Predicate Classes (PC) (≈conjugations)

“Spoiling” information, but demonstration out of scope

Distribution unclear again, at least partially lexical (although some semantic motivation)

Tagging:	PCA	PCB	PCC	PCD
	∅	<i>rū</i>	<i>ī</i>	<i>ì</i>

#### 3 “modes” for predicates

Tagging:	Imperative ( <i>2SG only</i> )	Non-Imperative	
		Non-nominalized	Nominalized

## 6. Results

**A single morpheme, \*ã, “compensates” for most “gaps” in slots OBJ (②) and SBJ (④)**

\*ã may appear in two rather different morphological positions, and in both at the same time

In slot ⑦ it can encode both SBJ or OBJ arguments, from both C2 or C1/3/5

Synchronically, most morphemes where \*ã can be detected are **fusional morphology**, in a mostly agglutinative language

When \*ã (⑦) encodes SBJ (in “Nominalized mode”), its encoding a C2 or a C1/3/5 relies on absence vs. presence of toneme change on \*ã

**=> class agreement through presence/absence of toneme change**

(Cf. C2 nominalizations (segmentally identical to C5 nominalizations): no toneme change before NMLZ (while toneme change in C5 –and all other– nominalizations) => general question of what toneme change is synchronically and diachronically in Ticuna)

## An interpretation of how SBJ or OBJ function encoding is assigned to \*ā (⑦)

④

**SBJ**

Filled

Capts SBJ

⑦

**\*ā**

Receives OBJ

⑦

**\*ā**

Receives SBJ

⑦

**\*ā**

Capts SBJ

⑨

**\*ā**

Receives OBJ

## An interpretation of how SBJ or OBJ function encoding is assigned to \*ā (⑦)

④  
SBJ  
Filled  
Capts SBJ

⑦  
\*ā  
Receives OBJ

⑦  
\*ā  
Receives SBJ

**BUT receives OBJ** in Imperative “mode”  
AND “Nominalized mode” with (covert) 4<sup>th</sup> person SBJ  
while slot SBJ (④) empty

⑦  
\*ā  
Capts SBJ

⑨  
\*ā  
Receives OBJ

## Possible interpretation of last observation

In Imperative “mode”: SBJ is covertly filled with 2SG?

**SBJ**  
Covertly filled

⑦  
**\*ā**

Receives OBJ

In “Nominalized mode” with (covert) 4<sup>th</sup> person **SBJ**: there is really no SBJ function? (indeed often generic meaning; or \*ā is then actually SBJ of anticausative, and no real 4<sup>th</sup> person SBJ possible?)

⑦  
**\*ā**

Receives OBJ  
(for want of SBJ)

Still much to say about SMAT's predicative head's inflectional morphology (**differential object marking, different grades of boundness, exact semantics, etc.**)!

But exact number of slots and contents of slots rather clear, with interesting insights into diachrony.

Antoine

Lev, Amalia

You all!

If NOT “Nominalized mode”, \*ã (⑦) encodes C1/3/5.OBJ

If “Nominalized mode”:

if intransitive predicate:

if \*ã (⑦) receives toneme change, it encodes C2.SBJ

if \*ã (⑦) does NOT receive toneme change, it encodes C1/3/5.SBJ
